# **Curves/Diagrams**

## **TEACH-IN**

- . Switch position "N" (normal operation):
- Yellow LEDs light if the light beam is free, flash if the functional reserve is used, turn off if the light beam is interrupted.
- Switch position "T" (TEACH-IN operation):

Yellow LED flashes slowly after 1 second (about 1.5 Hz).

The sensor is now ready to be set to a particular contrast detection value using the mechanical switch (position I, II, or III) or an external signal.

- . Switch positions "I", "II", and "III" (contrast detection operation)
- Contrast detection values: I for 10 %, II for 18 %, III for 40 %
- 1. Yellow LED lights continually: light path free
- 2. Yellow LED off: object detected
- 3. Yellow LED flashes quickly: unsure detection, too much contamination, functional reserve too low.
- A direct switching of the contrast detection levels is possible without having to put the switch back into position "T" first.
- External teach input (ET):

In switch position "T", you can apply a pulse over a control line to plug pin 5 to select the corresponding contrast detection. The desired contrast detection is set by applying a high pulse of a particular width:

50 ms (30 ms ... 100 ms) II: 150 ms (100 ms ... 200 ms)

III: >200 ms

# Pre-fault output (optional): Switch position "N":

Inactive if the functional reserve is used after approx. 5 sec. Immediately inactive if 4 light beam interruptions occur within the flashing time.

#### Contrast detection levels:

The output goes inactive if the contamination no longer permits readjustment; the yellow LED flashes quickly. In the case of additional contamination, the detection of low contrast is no longer guaranteed.

Warm-up period:

Any warm-up period can be shortened by repeating the learn (teach) process.
